

OLINGE BISIMWA JUNIOR

Full-Stack Software Engineer · Algorithmic Trading Systems

juniorbisim@gmail.com | +257 68 77 56 95 | github.com/jobjunior14

SUMMARY

Full-stack software engineer specializing in scalable backend systems and algorithmic trading software (C++/MQL5). Production experience designing, deploying, and maintaining a live trading platform on AWS, alongside cross-platform mobile and web applications in TypeScript and Python. Fluent in French and Swahili, good in English — comfortable operating across regional and international teams.

SKILLS

Languages: C++ | MQL5 | TypeScript | Python | PHP | Java

Frameworks: NestJS, NextJS, ExpressJS, React Native | Flask | Symfony | Spring Boot

Databases: MongoDB | PostgreSQL | MySQL

APIs & Infra: GraphQL | REST | AWS Lambda & CloudFront | Serverless Framework | Prisma | Linux system administration

Spoken languages: French (fluent) | Swahili (fluent) | English (Good) | Kirundi (intermediate)

PROFESSIONAL EXPERIENCE

Lead Engineer - The SA (streaming & course platform) / Co-founder - The SA EA

Ongoing

Designed, built, and deployed THE SA, a streaming and course platform, along with its algorithmic trading service, The SA EA, for MetaTrader 5 (Synthetic Indices, Forex) — end-to-end across trading engine, streaming infrastructure, and billing/delivery.

- Developed the backend platform in Node.js/TypeScript (Express, Prisma) deployed serverless on AWS Lambda and CloudFront, serving software licensing, updates, and binary distribution.
- Built the frontend in NextJS/TypeScript, deployed on AWS Amplify, with the course-streaming layer backed by AWS S3 storage and CloudFront for global content distribution and caching.
- Managed platform-wide routing with AWS Route 53.
- Built a Telegram bot (Telegraf) handling subscription payments and automated license delivery to end users.
- Architected a production MQL5 Expert Advisor (The SA EA) implementing multi-timeframe supply/demand zone detection (H4 zone identification, M5 entry logic), a Wyckoff accumulation/distribution engine, and Elliott Wave higher-timeframe trend tracking.
- Built a multi-level market structure tracker (break-of-structure / change-of-character detection) with real-time zone invalidation and liquidity-grab logic, including state persistence and crash-safe save/restore for live trading sessions.
- Migrated the production PostgreSQL schema (UUID → integer primary keys) with a custom two-phase migration script to safely resolve circular foreign key dependencies without downtime or data loss.

Front-end Engineer - Declic agency, England - Kinshasa

Aug 2026 - Sept 2026

- Developed the front-end interface for a government project where UI/UX intuitiveness was a central requirement, leveraging my UI/UX expertise to ensure clear, accessible navigation for a broad user base.

Fullstack Software Engineer - Wote, Kinshasa

June 2025 – Jan 2026

- Serving as Lead Tech at Wote, a creative and artistic company based in Kinshasa, DRC.

Fullstack Software Engineer - MTG Industrie, Goma

July 2025 – Sept 2025

- Developed a mobile application (React Native/Expo) for admin, operator, and customer roles to automate service-station operations, including QR-code scanning and a client bonus system, with a full admin dashboard — shipped for both Android and iOS.
- Scoped RFID card scanning as a planned feature extension for the platform.

Financial Literacy Trainer - TrezorAcademy, Burundi

4 workshops · 6 months

- Designed and delivered 4 one-week, in-person workshops in Gitega on financial independence through Bitcoin, reaching approximately 25 participants per session.
- Training delivered under subcontract with FreeTech; service formally validated by an official attestation.

PROJECTS

ONA — AI-powered mobile vision screening (open source)

github.com/Wezalab/ona

- AI-powered mobile vision screening application for community health workers, helping detect early signs of vision impairment and preventable blindness in children and adults.
- Runs offline on low-cost Android devices, designed to be deployed directly in the clinics and communities that need it most.
- Open source project built by [WEZA LAB](#) in the Democratic Republic of Congo, licensed under [Apache 2.0](#).

NailIt — React Native / Expo mobile app

github.com/jobjunior14/NailIt

- Built a mobile marketplace app addressing delivery logistics and price negotiation for local goods and services in an African market context.
- Designed a social-feed-style interface (familiar UX pattern) integrated with an in-app payment and billing system.

EDUCATION

Bachelor's Degree in Software Engineering (Bac +4)

University Polytechnique of Gitega, Burundi

- Relevant coursework: Data Structures & Algorithms, Database Management, Linux Systems Administration & Security, Object-Oriented Design Patterns, Data Analysis.
